File Ref.No.8957/GA - IV - J1/2012/CU

UNIVERSITY OF CALICUT

Abstract

General and Academic IV -Faculty of Science -Scheme and Syllabus of M.Sc Physics (Nano Science) Programme w.e.f 2022 Admission in tune with Regulations under Choice-based Credit Semester System for Post Graduate Programmes (CCSS PG-2022) - Revised-Implemented - Subject to ratification by Academic Council -Orders Issued.

G & A - IV - J

U.O.No. 24260/2022/Admn Dated, Calicut University.P.O, 29.12.2022

Read:-1. U.O.No. 11067/2022/Admn dated, 03.06.2022

2. Item No.1 of the Minutes of the meeting of the Board of Studies in Nanoscience and Technology held on 04.11.2022
3. Item No.2 in the meeting of Faculty of Science, held on 17.11.2022
4. Item No.II.F in the LXXXIV Academic Council meeting held on 15.12.2022
5. Orders of the Vice chancellor in the file of even no, Dated 24.12.2022.

ORDER

1. The scheme & syllabus of M.Sc Physics (Nano Science), in tune with Regulations under Choice-based Credit Semester System for Post Graduate Programmes (CCSS PG-2022) of all Teaching Departments / Schools of the University of Calicut, is implemented with effect from 2022 Admission, vide paper read (1) above.
2. The meeting of the Board of Studies in Nanoscience and Technology (Single Board), held on 04.11.2022, vide paper read (2) above, has resolved to approve the revised scheme & syllabus of M.Sc Physics (Nano Science) in tune with Regulations under Choice-based Credit Semester System for Post Graduate Programmes (CCSS PG-2022) of all Teaching Departments / Schools of the University of Calicut, w.e.f. 2022 admission.
3. The Faculty of Science approved the revised scheme & syllabus of M.Sc Physics (Nano Science) in tune with Regulations under Choice-based Credit Semester System for Post Graduate Programmes (CCSS PG-2022) of all Teaching Departments / Schools of the University of Calicut, w.e.f. 2022 admission, vide paper read (3) above.
4. The LXXXIV Academic Council meeting held on 15.12.2022 approved the revised scheme & syllabus of M.Sc Physics (Nano Science) in tune with Regulations under Choice-based Credit Semester System for Post Graduate Programmes (CCSS PG-2022) of all Teaching Departments / Schools of the University of Calicut, w.e.f. 2022 admission, vide paper read (4) above
5. The scheme and syllabus of M.Sc Physics (Nano Science) in tune with Regulations under

Choice-based Credit Semester System for Post Graduate Programmes (CCSS PG-2022) of all Teaching Departments / Schools of the University of Calicut, w.e.f. 2022 admission, is therefore implemented with effect from 2021 Admission.

6. Orders are issued accordingly. (Scheme and Syllabus appended)

October 2022

UNIVERSITY OF CALICUT

Scheme and Syllabus for

M.Sc. Physics (Nanoscience) (Code: FSCNSPHMSC)

Under (CCSS-PG-2022)

Department of Nanoscience and Technology, School of Physical Sciences,

University of Calicut, (w.e.f. 2022 admission onwards)

ELIGIBILITY FOR ADMISSION

B.Sc. Degree in Physics of this university or an equivalent degree, with Mathematics and Chemistry as compulsory complementary, having 50% marks or equivalent grade in Part III (Core and complementary put together) are eligible to apply for this programme. OBC/OEC candidates are eligible for relaxation up to 5%. SC/ST candidates need only to get a pass.

ADMISSION PROCEDURE

Admission to this MSc program shall be based on entrance examination conducted among eligible candidates and successful candidates shall be ranked according to the entrance test marks. Program structure, evaluation and grading will be as per the Choice-based Credit Semester System PG - CCSS Regulations for Post Graduate Programmes of Teaching Departments/Schools of the University of Calicut. Intake is 10.

SCHEME AND CURRICULUM OF THE PROGRAM

- M.Sc. Physics (Nanoscience) is a PG program of 2 years duration with 4 semesters. The program includes Core, Elective and Audit courses. The total credit of the program (excluding audit courses) is **86**.
- The total credits of the Audit courses shall be 4 and this credit point will not be considered while calculating the SGPA/CGPA.
- Total credits for the core courses (Theory, Practical, Project) shall be **70**.
- The Project work is compulsory for all students and the credit points assigned is **8.**
- Total credits for the elective courses shall be **16**
- Accumulated minimum credits required for successful completion of the program is **86 (+ 4 credits of the Audit course)**
- Minimum credits required from core courses (Theory, Practical, Project) is **70**
- Minimum credits required from elective courses is **16**
- Minimum attendance required is **75 %**
- Evaluation and grading will be done as per CCSS PG Regulations 2022 - Regulations for Post Graduate Programmes of Teaching Departments/Schools of the University of Calicut

Program Educational Objectives (PEOs)

The PG programme, **M.Sc. Physics (Nanoscience)** offers a well-balanced curriculum that ensures the career prospects of the students with due consideration is given to capacitate the students to face the challenges posed by the specialized areas of knowledge in the global arena. Since Nanoscience being an applied science and has application in various fields, in other words, being a vastly interdisciplinary area with great fluidity, the competence of the students can be improved with specialization and focus on chosen areas.

PEO-1	To bring students from different branches of Science under one roof to get benefits of each other's to develop a purely multidisciplinary group to work in the area of applied research focusing the science and technology close to nano regime
PEO-2	Solid foundation in their respective core subjects such as physics and chemistry in addition to nanoscience and technology
PEO-3	Good theoretical and practical knowledge so as to comprehend, analyse, design, and create products and solutions for the real-life problems
PEO-4	Facilitate the students to develop research attitude to do innovative research in diverse area of Nanoscience and Technology
PEO-5	Facilitate research ambiance and practical experiences with advanced technologies for the understanding of exceptional properties shown by matter at nanoscale
PEO-6	Professional and ethical attitude, effective communication skills, teamwork skills, multidisciplinary approach, and an ability to relate nanotechnology to address energy, environmental and biomedical applications
PEO-7	Train the student to design a research problem and the selection of methodologies for meeting the fixed objectives to solve the problem.
PEO-8	Facilitate the student to interact with the peers in other disciplines in industry and society and contribute to the economic growth of the country.

Program Specific Outcomes (PSOs)	
PSO-1	Recognise and relate the theories and principles of physics and chemistry for understanding the scientific phenomenon in nano domain
PSO-2	Understand and apply the mathematical techniques for describing and deeper understanding of nano systems.
PSO-3	Understand the quantum mechanical concepts and apply the same in various physical systems and processes at nano regime
PSO-4	Understand and apply the inter-disciplinary concepts and computational simulations to describe natural phenomenon.
PSO-6	Provide exposure in various specializations in the field of Nanoscience with frequent updates
PSO-7	Provide exposure to advanced experimental/theoretical methods for measurement, observation, and fundamental understanding of phenomenon at nanoscale and nanosystems.
PSO-8	Provide practical experience in both physical and chemical sciences with judiciously designed experiments for imparting the research attitude.
PSO-9	Contribute adaptive thinking and adaptability to protect the environment for sustainable development
PSO-10	Well-tempered professional ethics essential to maintain a transparent career
PSO-11	The basic understanding of how interdisciplinary science works to coordinate Nanoscience and Technology.
PSO-12	The vital awareness of computational/mathematical programs to solve the bottleneck issues in different aspects of science and technology.
PSO-13	New ideas to develop advanced nanomaterials for sustainable/eco-friendly energy, clean water, pollution-free air, and modern biology.

Program Outcomes (POs)	
PO-1	Illustrate the fundamental concepts of classical mechanics and relate it to the progression towards quantum mechanics.
PO-2	Provide extensive knowledge to solve quantum mechanical and solid state physics problems and relate them to nanoscience.
PO-3	Provide comprehensive understanding on physics and chemistry of solids, to explain the working of semiconductor based electronic and photonic devices and relate them to nanoscale electronics.
PO-4	Provide a comprehensive understanding of statistical mechanics and chemical kinetics and relate them to the growth of nanoparticles.
PO-5	To familiarize fundamental concepts of nuclear and particle physics and relate them to the characterization of nanomaterials.
PO-6	Illustrate fundamental concepts of size and shape dependent changes in the properties of nanostructured materials for various applications.
PO-8	Demonstrate ability to design new nanostructured materials, characterize, interpret and analyse the data using the theories related physics and chemistry for catering the needs of the industry.
PO-9	Demonstrate new ideas for addressing the problems of the 21st century *viz.*, energy crisis and environmental remediation using the knowledge provided through specific electives.
PO-10	Develop confidence in self-educating new knowledge and gain the ability for life-long learning.
PO-11	Develop the knowledge to use computational methods to address the activities of different bio-active compounds.

University of Calicut, Kerala- 673635

M.Sc. Physics (Nanoscience)

Course and Credit Distribution Summary (2022 admission onwards)

Semester	Code	Subject	Type	Total Marks	Credits
First Semester	NSP1C 01	Classical Mechanics	Core	100	4
	NSP1C 02	Electronics	Core	100	4
	NSP1C 03	Mathematical Physics	Core	100	4
	NSP1C 04	Quantum Mechanics -I	Core	100	4
	NSP1C 05	Physics and Chemistry of Solids	Core	100	4
	NSP1P 01	Practical-I	Core	100	2
	NSP1A 01	Ability Enhancement Course (AEC)	Audit	-	2*
		TOTAL		**600**	**22**
Second Semester	NSP2C 06	Statistical Mechanics	Core	100	4
	NSP2C 07	Electrodynamics	Core	100	4
	NSP2C 08	Quantum Mechanics -II	Core	100	4
	NSP2C 09	Introduction to Nanomaterials	Core	100	4
	NSP2C 10	Spectroscopy	Core	100	4
	NSP2P 02	Practical – II	Core	100	2
	NSP2A 02	Professional Competency Course (PCC)	Audit		2*
	TOTAL			**600**	**22**
Third Semester	NSP3C 11	Nuclear and Particle Physics	Core	100	4
	NSP3C 12	Advanced Analytical Techniques	Core	100	4
	NSP3C 13	Design, Synthesis and Properties of Nanomaterials	Core	100	4
	NSP3C 14	Computational Nanotechnology	Core	100	4
	NSP3E 01	Elective – I (Open Elective)	Elective	100	4
	NSP3P 03	Practical-III	Core	100	2
	TOTAL			**600**	**22**

Fourth Semester	NSP4E --	Elective – II	Elective	100	4
	NSP4E --	Elective – III	Elective	100	4
	NSP4E --	Elective – IV	Elective	100	4
	NSP4PR 01	Project	Core	100	8
	TOTAL	**-**		**400**	**20**
		TOTAL CREDITS: 86			

*The credits for the audit courses (NSP1A 01 and NSP2A 02) will not be counted for computing the SGPA/CGPA of the student. Students have to obtain only pass minimum requirements in the audit courses.

Code	Subject	Type	Total Marks	Credits
NSP4E 01	Nanstructured Solar Cells	Elective	100	4
NSP4E 02	Nanomaterials for Photocatalysis and Solar Fuel Generation	Elective	100	4
NSP4E 03	Micro/Nano Electro-mechanical Systems (MEMS/NEMS)	Elective	100	4
NSP4E 04	Sustainable Nanomaterials	Elective	100	4
NSP4E 05	Nanomaterials for Supercapacitor Aapplications	Elective	100	4
NSP4E 06	Computational Studies on Bio-active Compounds	Elective	100	4
NSP4E 07	Precision Nanoclusters: Origin and Applications	Elective	100	4
NSP4E 08	Materials in Medicine	Elective	100	4
NSP4E 09	Solid State Physics of Materials	Elective	100	4

More Elective courses will be added in near future.

Audit courses:

Two audit courses **Ability Enhancement Course** (AEC) &**Professional Competency Course** (PCC), each with 2credits are to be done within the first two semesters of the PG program. The credits will not be counted for computing the overall SGPA/CGPA of the student. The concerned department shall conduct examination for these courses and shall intimate /upload the results of the same to the University on the stipulated date during the III Semester. The student has to obtain only minimum pass requirements in these two courses. Detailed syllabus is framed for both audit courses.

EVALUATION AND GRADING: As per the Calicut University Regulations under Choice Based Credit Semester System for Postgraduate Programmes (CCSS-PG) of the University Campus Departments.

PATTERN OF QUESTION PAPER FOR CORE AND ELECTIVE COURSES:

M.Sc. Physics (Nanoscience)

Time: 3 hours **Total Marks = 50**

Section A

Ten Compulsory short answer type questions of one mark each
(Total Marks = 10 **x 1=10 Marks)**

Section B

Eight paragraph answer type questions, the students shall answer 4 question each of four marks **(**Total Marks **= 4 x 4 = 16 marks)**

Section C

Eight essay/problem type questions, the students shall answer four questions, each of six marks
(Total Marks = **4 x 6=24 marks**)

SYLLABUS

M.Sc. Physics (Nanoscience)
(Code: FSCNSPHMSC)

Core Papers

Course Code	NSP1C 01	CLASSICAL MECHANICS	L	T	P	C
Core			4	0	0	4
Pre-requisite	Basic knowledge in general physics		Syllabus Version	2022		

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

The main objectives of the course are to:

- Understand the fundamental concepts and principles in of classical physics.
- Learn different theorems and the associated mathematical derivations.
- Understand the dynamics of different systems.
- Learn and develop mathematical skills applied to physics.

Course Outcomes

1. Remember the fundamentals of classical mechanics – K1
2. Understand the motion of a mechanical system using Lagrange and Hamiltonian formulations – K2
3. Understand some mathematical concepts needed and skill to solve problems– K2, K3, K5
4. Understand the differences between linear and non-linear oscillations– K1

K1 – Remember K2 – Understand K3 – Apply K4 – Analyze K5 – Evaluate

UNIT-I	**Lagrangian and Hamiltonian Formulations**:	**15 Hours**

D'Alemberts principle and Lagrange's equation, Velocity dependent potentials, Simple applications of Lagrangian formulation, Hamilton's Principle, Conservation theorems and symmetries, Lagrange's equation from Hamilton's principle, Two- body central force problems, Equivalent one - body and one-dimensional problem, Kepler problem, Inverse square law of force, Laplace-Lenz vector, Scattering in a central force field, Transformation to lab coordinates.

UNIT-II	**Kinematics of Rigid Body Motion**:	**15 hours**

Independent co-ordinates, orthogonal transformation, Transformation matrix, Euler angles, Euler theorem, Infinitesimal rotation, Rate of change of a vector, Centrifugal and Coriolis forces, Inertia tensor, Euler's equation of motion, Torque-free motion of a rigid body, Precession of Equinoxes and satellite orbits.

UNIT-III	**Small Oscillations**:	**15 Hours**

Formulation of the problem, Eigenvalue equation, Eigenvectors and Eigenvalues, Orthogonality, Principal axis transformation, Frequencies of free vibrations, Normal coordinates, Free vibrations of a linear triatomic molecule, Forced vibration and Dissipative forces.

UNIT-IV	**Hamiltonian Formulations**:	**17 Hours**

Legendre Transformation and Hamilton's equations, Cyclic co-ordinates and conservation theorems, Principle of least action, Canonical transformations and examples, Infinitesimal canonical transformations, Poisson brackets and other canonical invariants, Equation of

motion in Poisson bracket form, Angular momentum Poisson brackets. Hamilton-Jacobi equation, Hamilton's principal and characteristic function, H-J equation for the linear harmonic oscillator, Separation of variables, Action-angle variables, H-J formulation of the Kepler problem, H-J equation and the Schrodinger equation.		
UNIT-V	**Nonlinear Equations and Chaos**	**10 Hours**
Introduction, Singular points of trajectories, Nonlinear oscillations, Limit cycles, Chaos: Logistic map, Definitions, Fixed points, Period doubling, Universality.		
	Total Lecture Hours	**72 Hours**
Text Books/References		

Text Books:

1. Herbert Goldstein, Charles P.Poole and John Safko : "Classical Mechanics" (3rd Edition, Pearson Education,2011)
2. V.B.Bhatia : "Classical Mechanics" (Narosa Publications,1997)

Books for Reference:

1. Michael Tabor: "Chaos and Integrability in Nonlinear Dynamics" (Wiley,1989)
2. N.C.Rana and P.S.Joag : "Classical Mechanics" (Tata McGraw Hill,2011)
3. R.G.Takwale and P.S.Puranik : "Introduction to Classical Mechanics"(Tata McGraw Hill, 1978)
4. Atam P. Arya, Introduction to Classical Mechanics, 2nd Edn.,Addison Wesley,1998)
5. Muthusamy Lakshmanan, Shanmuganathan Rajaseekar : "Nonlinear Dynamics" (Springer Verlag,2002).

Course Code	NSP1C 02	ELECTRONICS	L	T	P	C
Core			4	0	0	4
Pre-requisite	Basic knowledge in general physics and basic electronics		Syllabus Version	2022		

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

The main objectives of the course are to:

- To understand bi-junction uni-junction transistor amplifiers and their frequency performances and applications.
- To understand the architecture and performance of various semiconductor components for microwave and photonic devices
- To understand the architecture and working of an Op-Amp and its characteristics and equivalent circuit
- To understand the practical applications of an Op-Amp

Course Outcomes

1. Analyze the performance and differentiate voltage and current amplifiers and design a public address system -K4, K5
2. Analyze the frequency response, input and output impedances of various Op-Amp based circuits for practical applications – K4
3. Analyze arithmetic logic circuits, and apply the knowledge to explain the working of various counters and registers - K3, K4
4. Design a microprocessor-based circuit for practical applications- K5

K1– Remember K2 – Understand K3 – Apply K4 – Analyze K5 – Evaluate

UNIT-I	Field Emission Transistors	17 Hours

BJT: Biasing and ac models, Voltage amplifiers, Power amplifiers, Emitter follower. FET: h-parameters, FET small signal model, Biasing FET, Analysis of common source and common drain amplifiers at low and high frequencies, FET as VVR and its applications. MOSFET: Circuit symbol and equations, small signal model, CMOS and Digital MOSFET gates.

UNIT-II	Digital Electronics:	15 hours

Combinational systems - Synthesis of Boolean functions, Boolean algebra, Universal gate - NAND, Integrated NAND circuit, Arithmetic circuits, Adder, Subtractor, BCD Addition, 2’s complementary technique, Sequential systems - Flip flops-RS, JK, JK-MS, D-FF, Register, Buffer register, serial and parallel registers, Tristate switches, Tristated buffer registers, Bus organisation in computers, Counters, Synchronous and Asynchronous counters, Ripple counters, Ring counter, Timing diagram, Fundamentals of D/A conversion, -Accuracy and resolution - ADC/DAC chips, Flash Converters

UNIT-III	Operational Amplifier (OPAMP)	15 Hours

Ideal amplifier - operational amplifier - the basic operational amplifier, differential amplifier and its transfer characteristics, frequency response of operational amplifiers, adder,

subtractor, Op-amp as differentiators, integrators, applications of differentiators and integrators, Solution of differential equations – general ideas about analog computation and simulation – other applications of Op-amps, filters, comparators, sample and hold circuits, waveform generators.		
UNIT-IV	**OPAMP Applications**	**15 Hours**
Summing, scaling and averaging amplifiers, Analog integrator and differentiator, Electronic analog computation, Active filters: Low pass, High pass, band pass, Butterworth filters, Oscillators: Phase shift, Wein bridge, Quadrature oscillators, Square, triangular and saw-tooth wave generators, comparators, zero crossing detectors, Schmitt trigger (12 hours)		
UNIT-V	**Applications of Electronic Devices in Materials Science**	**10 Hours**
Tunnel diode, Transferred electron devices, Negative differential resistance and devise operation, Radiative transitions and optical absorption, Light emitting diodes (LED) – Visible and IR, Semiconductor lasers - materials, operation (population inversion, carrier and optical confinement, optical cavity and feedback, threshold current density), Photo-detectors, Photoconductor (Light dependent resistor- LDR) and photodiode, p-n junction solar cells - short circuit current, fill factor and efficiency.		
	Total Lecture Hours	**72 Hours**

Course Code	NSP1C 03	MATHEMATICAL PHYSICS	L	T	P	C
Core			4	0	0	4
Pre-requisite	Basic knowledge in Mathematics and Physics		Syllabus Version		2022	

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

The main objectives of the course are to:

- Understand the fundamentals of Mathematical Physics
- Recognize mathematics as the language of nature to explain different physical phenomena
- Understand the use of Physics to address the fundamental questions in nature.
- To understand the applications of Mathematical tools for solving physical problems

Course Outcomes

1. Understand different coordinate systems and apply the same to solve Laplace's equation- K2, K3
2. Identify tensors, their classifications and application -K2
3. Recognize differential equations of special nature and analyse their solutions to address atomic, molecular and solid-state physics -K2,K4
4. Apply Fourier series and integral transforms of different types to analyse or solve mathematical problems in physical sciences-K3

K1- Remember K2 – Understand K3 – Apply K4 – Analyze K5 – Evaluate

UNIT-I	Vector Analysis	12 Hours

Vectors and scalars- Direction angles and direction cosines -Change of coordinate system- The linear vector space Vn - Vector differentiation - Space curves - Motion in a plane -Conservative vector field-The divergence of a vector, Laplacian- The curl of a vector Formulas involving ∇ - Orthogonal curvilinear coordinates cylindrical coordinates, Spherical coordinates -Vector integration and integral theorems- Helmholtz's theorem

UNIT-II	Matrices and Tensors	15 hours

Basic properties of matrices(review), Orthogonal matrices, Hermitian and Unitary matrices, Similarity and unitary transformations, Diagonalization of matrices. Definition of Tensors, Contravariant and covariant tensors – transformation rules – direct product, contraction, quotient rule. Metric tensor – lowering and raising of indices – covariant derivatives – Christoffel symbols.

UNIT-III	Second Order Differential Equations & Special Functions	20 Hours

Partial differential equations, first order equation, second order equation, Separation of variables, Laplace and poisson equation, wave and heat equations in two and three dimensions.

Gamma and Beta functions and its properties. Frobenius method for solving second order ordinary differential equations with variable coefficients. Bessel, Legendre, Hermite and

Laguerre equations. Recurrence relations, Generating functions and Rodrigues formulae for the Bessel, Legendre, Hermite and Laguerre functions. Green's function.		
UNIT-IV	**Functions of Complex Variables**	**15 Hours**
Introduction, Analyticity, Cauchy-Reimann conditions, Cauchy's integral theorem and integral formula, Laurent expansion, Singularities, Calculus of residues and applications. Calculus of Variations, Euler equation, variation with constraints.		
UNIT-V	**Integral Transforms**	**10 Hours**
Fourier Series, General properties, Advantages, Uses of Fourier series, Properties of Fourier series, Fourier integral, Fourier transform, Properties, Inverse transform, Transform of the derivative, Convolution theorem, Laplace transform, Inverse Transform and Convolution theorem.		
	Total Lecture Hours	**72 Hours**
Text Books/References

Course Code	NSP1C 04	QUANTUM MECHANICS- I	L	T	P	C
Core			4	0	0	4
Pre-requisite	Basic knowledge in general physics, Chemistry and mathematics.		Syllabus Version	2022		

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

- Understand the fundamental concepts and principles in quantum mechanics for different systems.
- Learn the method of solving problems quantum mechanically.
- Understand the concepts of statistical mechanics.
- Learn the method of evaluation of kinetics and thermodynamics of chemical reactions.

Course Outcomes

1. Remember the fundamentals of classical mechanics – K1
2. Understand some mathematical concepts – K2
3. Understand different postulates of QM and solving problems based on it – K2, K3
4. Understand QM of different systems – K1
5. Problem solving, evaluation and analysis capacity – K3, K4, K5

K1– Remember K2 – Understand K3 – Apply K4 – Analyze K5 – Evaluate

UNIT-I	Origin of Quantum Mechanics & its Postulates	16 Hours

Plank's quantum hypothesis, Einstein's photoelectric effect, wave particle duality, de Broglie matter waves, Electron diffraction, Heisenberg's Matrix Mechanics (brief mention), Schrodinger wave mechanics, Deduction of Schrodinger equation from classical wave equation. Polar and spherical coordinates. Schrodinger Equation and Wave Packets, Poisson Brackets and Commutators, State function postulate, Operator postulate, Eigen value postulate, Expectation value postulate, Postulate of time dependent Schrodinger Equation of motion, Conservative system and time-independent Schrodinger equation, Stationary states, Formulation of quantum mechanical problem.

UNIT-II	Quantum Mechanics of Different Systems & Angular Momentum	20 hours

Quantum mechanics of translational motion- particle in 1D and 3D box. Tunneling. Vibrational motion- One-dimensional harmonic oscillator. Rotational motion- Rigid rotator. Spherical harmonics. Quantization of angular momentum, quantum mechanical operators corresponding to angular momenta ((Lx, Ly, Lz), commutation relations between these operators. Clebsh-Gordon coefficients. Spin Angular Momentum- Spin 1/2 and the Pauli Matrices. Coupling of Orbital and Spin Angular Momenta.

UNIT – III	Quantum Mechanics of Hydrogen Like Atoms	16 Hours

Potential energy of hydrogen-like systems. The wave equation in spherical polar coordinates, Separation of variables. The R, Theta and Phi equations and their solutions. Laguerre and Associate d Laguerre polynomials. Wave funcitons and energies of hydrogen-like atoms, Orbitals. Radial functions and Radial distribution of functions and their plots Angular functions and their plots, Orbital diagrams. Explanation of Hydrogen spectrum, Fine structure, The postulate of spin by Unlebeck and Goldsmith, Dirac's Relativistic Schrodinger

equation for hydrogen atom and discovery of spin, Hydrogen wave functions including spin or spin orbitals, construction of Spin orbitals from Obritals and Spin functions.		
UNIT - IV	**Conservation and Scattering**	**15Hours**
Space-time symmetries- Space translation and conservation of linear momentum, Time translation and conservation of energy, Space rotation and conservation of angular momentum, Space inversion and time reversal. Identical particles- Identical Particles in Classical and Quantum Mechanics, Exchange Degeneracy, Scattering cross section and scattering amplitude, Low energy scattering by a central potential, The method of partial waves, Phase shifts, Optical theorem, Convergence of partial wave series, Scattering by a rigid sphere, Scattering by a square well potential, High energy scattering, Scattering integral equation and Born approximation.		
UNIT-V	**Contemporary Issues**	**5 Hrs**.
Expert lectures, General Seminars, online seminars – webinars		
	Total Lecture Hours	**72 Hours**

Course Objectives

- To experimentally realize the concepts in Physics, Chemistry and nanoscience
- To expose students to common topics in Physics and Chemistry to understand nanoscience

Course Outcomes

1. Gain practical knowledge by applying the experimental methods to correlate with the theory – K4
2. Apply and understand the various procedures and techniques for the experiments in physics and chemistry experiments – K2, K3
3. Apply the analytical techniques and graphical analysis to interpret the experimental data – K3, K5
4. Develop intellectual communication skills and discuss the basic principles of scientific concepts in a group – K3

K1– Remember K2 – Understand K3 – Apply K4 – Analyze K5 – Evaluate

List of Experiments: GENERAL PHYSICS

1. Determination of particle size of lycopodium powder using He-Ne laser
2. Determination of wavelength of laser light using diffraction grating
3. Hall effect in semiconductors: Determination of carrier concentration
4. Energy gap of a semiconductor: Four Probe Method
5. Photoelectric effect: Determination of Planck's constant
6. Study of I-V characteristics of semiconductor thin films
7. Measurement of dielectric constant of solids and liquids
8. Determination of concentration of unknown solution through UV-Vis spectrophotometer: Verification of Beer-Lambert's law
9. Determination of crystal structure, grain size and lattice parameters using XRD data of a given sample

List of Experiments: ELECTRONICS (Selected Experiments)

10. Inverting Amplifier, Non-inverting Amplifier and Difference Amplifier
11. Schmitt Trigger
12. Sawtooth Generator
13. Differentiator and Integrator
14. Low pass filter, High pass filter and Band pass filter
15. Astable Multivibrator
16. Single stage RC coupled Amplifier
17. Differential Amplifier using Transistor

Course Objectives

The main objectives of the course are to:

- Recognize the statistical foundations of thermodynamics
- Understand the fundamental principles of equilibrium statistical physics
- Analyse the connection and dichotomy between classical and quantum statistics
- Learn the behaviour of Bose and Fermi gases based on quantum statistical physics
- Familiarise phase transitions and non-equilibrium statistical mechanics

Course Outcomes

1. Discuss the connection between statistics and thermodynamics – K4
2. Demonstrate and understand the terminology, concepts and principles related to physical systems in a statistical mechanical framework – K3
3. Derive partition function and compute thermodynamics relations for various real-world physical systems – K6
4. Explain aspects of the statistical physics of systems with an interaction between its constituent components – K4

K1- Remember K2 – Understand K3 – Apply K4 – Analyze K5 – Evaluate K6- Create

UNIT-I	**Foundations of Statistical Mechanics**:	**13 Hours**
Specification of states of a system, Contact between statistics and Thermodynamics, Classical Ideal gas, Entropy of mixing and Gibbs paradox, Sackur-Tetrode Equation.		
UNIT-II	**Ensemble Theory**	**17 hours**
Microcanonical ensemble, phase space, trajectories and density of states, Liouville's theorem, canonical and grand canonical ensembles, partition function, Equipartition Theorem, calculation of statistical quantities.		
UNIT-III	**Quantum Statistical Mechanics**:	**15 Hours**
Density matrix, statistics of Microcanonical, Canonical and Grand canonical Ensemble, Example: Electron in a magnetic field, Free Particle in a box, Statistics of indistinguishable particles.		
UNIT-IV	**Ideal Systems**	**17 Hours**
Density matrix of a system of non-interacting particles. Ideal gas in quantum mechanical ensembles, Maxwell-Boltzman, Fermi-Dirac and Bose-Einstein statistics, Thermodynamics of ideal Bose and Fermi gases, Bose-Einstein condensation.		
UNIT-V	**Phase Transitions and Fluctuations**	**10 Hours**
Problem of condensation, Yang and Lee Theory, Dynamical model of Phase transitions, Ising Model in Zeroth approximation, Equilibrium thermodynamic Fluctuations, Brownian motion and Langevin theory, Exercises.		
	Total Lecture Hours	**72 Hours**

Course Code	NSP2C 07	ELECTRODYNAMICS	L	T	P	C
Core			4	0	0	4
Pre-requisite	Basic knowledge in general Physics		Syllabus Version	2022		

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

The main objectives of the course are to:

- Understand the fundamental theories associated with electrostatics and magnetostatics
- Analyse the propagation of electromagnetic waves through conducting and nonconducting media.
- Understand the propagation of electromagnetic waves through confined media
- Understand special theory of relativity and the relativistic formulation of electrodynamics.

Course Outcomes

1. Solve boundary value problems and wave equations and analyse the results-K3,K4
2. Understand basic concepts related to wave propagation and few of their applications -K2, K3
3. Understand electromagnetic wave propagation through waveguides and analyze the specific field patterns from antennas, K2, K4
4. Understand the blending of relativity and electrodynamics that motivates to study quantum field theory and symmetries , K2, K5

K1 – Remember K2 – Understand K3 – Apply K4 – Analyze K5 – Evaluate, K6- Create

UNIT-I	Electrostatics and Magnetostatics	20 Hours

Boundary value problems, Formal solution with Green's functions, electrostatic potential energy. Method of images- Point charge near a grounded conducting sphere-Point charge near a charged insulated conducting sphere - conducting sphere in a uniform electric field. Laplace equation in spherical polar coordinates- Boundary value problem with azimuthal symmetry. Multipole expansion Electrostatic multipole moments - energy of a charge distribution in an external field, electrostatics of macroscopic media - electric polarization and displacement, dielectric constant, boundary condition at the dielectric interface. Magneto statics: Biot-Sawart Law and its differential statement, Ampere's law. Vector potential

UNIT-II	Time Varying Fields	17 hours

Faraday's Law of electromagnetic induction - energy in a magnetic field – displacement current - Maxwell's equations. Vector and scalar potentials - gauge transformations - Lorentz gauge, Coulomb gauge, Poynting's theorem and conservation of energy and momentum, complex Poynting vector. Boundary conditions for the electric and magnetic fields at an interface- Plane electromagnetic wave in a non-conducting medium, linear and

circular polarization, reflection and refraction at a dielectric interface, polarization by reflection and total internal reflection.		
UNIT-III	**Waveguides and Radiating Systems**	**15 Hours**
Penetration of fields into the conductors, cylindrical cavities and waveguides, metallic waveguides, modes in a rectangular waveguide, resonant cavities. Simple radiating systems: Green's function for wave equation, fields and radiation of a localized oscillating source - electric dipole field and radiation, magnetic dipole and electric- quadrupole fields.		
UNIT-IV	**Relativistic Electrodynamics**	**15 Hours**
Special Theory of Relativity, Postulates of relativity, Lorentz transformations, four vectors, addition of velocities, four velocity, relativistic momentum and energy, mathematical properties of space-time, matrix representation of Lorentz transformation. Dynamics of relativistic particles. Lagrangian and Hamiltonian of relativistic charged particle, motion in a uniform static electric and magnetic field.		
UNIT-V	**Contemporary Issues**	**5 Hours**
Expert lectures, General Seminars, online seminars – webinars		
	Total Lecture Hours	**72 Hours**
Text Books/References		
1. J. D. Jackson, Classical Electrodynamics. 2. David J Griffiths, Introduction to Electrodynamics.		

Course Code	NSP2C 08	QUANTUM MECHANICS II	L	T	P	C
Core			4	0	0	4
Pre-requisite	Basic knowledge in general physics, Chemistry and mathematics.		Syllabus Version		2022	

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

The main objectives of the course are to:

- Understand the fundamental concepts and principles in quantum mechanics for different systems.
- Learn the method of solving problems quantum mechanically.
- Understand the concepts of statistical mechanics.
- Learn the method of evaluation of kinetics and thermodynamics of chemical reactions.

Course Outcomes

1. Evaluation of multi-electron systems by QM – K5
2. Understanding and evaluation of different approximation methods – K2, K5
3. Understand the concepts of relativistic QM – K2
4. Understand the fundamentals of group theory – K2
5. Application of GOT to derive character tables – K2, K3
6. Understanding applications of group theory in spectroscopy and chemical bonding – K2, K3, K4

K1– Remember, K2 – Understand, K3 – Apply, K4 – Analysis, K5 – Evaluate, K6- Create

UNIT – I	Approximation Methods	16 hours

Perturbation theorem: The WKB approximation, Connection formulae, Barrier tunneling, Application to decay- bound states, Penetration of a potential barrier, Time- independent perturbation theory. Illustration by application to particle in ID-box with slanted bottom, Perturbation treatment of the ground state of the helium atom. Transition probability, Harmonic perturbation, Interaction of an atom with the electromagnetic field, Induced emission and absorption.
Variation theorem: The variational equation with proof, ground state and excited states, the variation method for bound states, Application to ground state of the hydrogen and helium atoms.
HFSCF method: Hartree-Fock Self-Consistent Field (HF-SCF) method.

UNIT-II	Relativistic Quantum Mechanics	16 Hours

The Dirac equation, Dirac matrices, Solution of the free-particle Dirac equation. Spin-orbit coupling, Covariance of the Dirac equation, Bilinear covariants, Hole theory, The Weyl equation equation for the neutrino, Nonconservation of parity, The Klein Gordon equation, Charge and current densities, The Klein- Gordon equation, Charge and current densities, The Klein –Gordon equation equation with potentials, Wave equation for the photon,Charge conjugation for the Dirac, Weyl and Klein Gordon equation.

UNIT-III	Theories of Molecular Symmetry	15 Hours
Introduction to symmetry and point groups. Group multiplication tables. Similarity transformation. Reducible and irreducible representations. Construction of irreducible representations by reduction (similarity transformation). Great orthogonality theorem (GOT) and properties of irreducible representations using GOT, Construction of character Table (C_{2v}, C_{3v}, C_{2h}, C_{4v}). Nomenclature of irreducible representations - Mulliken symbols, Symmetry species. Reduction formula using GOT.		
UNIT- IV	Applications of Group Theory	20 Hours
a. Molecular vibrations, symmetry species of normal modes of vibration, Construction of Γ_{cart}. Normal coordinates and drawings of normal modes, Selection of rules for IR and Raman activities, complementary character of IR and Raman spectra, Determination of IR active and Raman active modes of molecules. b. Vanishing and non varnishing integrals. Transition moment integral and selection rules. Overlap integrals and conditions for overlap. c. MO theory for more complex molecules - HMO theory of linear conjugated hydrocarbons (Ethylene, Butadiene, Allylic anionFrost-Huckel circle mnemonic device for cyclic polyenes. **d.** Molecular orbital treatment of molecules using Group theory. Treatment of H_2O. Electronic transitions and selection rules, Laporte selection rule for centro symmetric molecules. **e.** Group theoretical treatment of hybidization, Construction of hybrid orbital in BF_3 and Inverse transformation.		
UNIT-V	Contemporary Issues	5 Hours
Expert lectures, General Seminars, online seminars – webinars		
	Total Lecture Hours	72 Hours

</table>

Course Objectives

1. Recognize the interdisciplinary area of Nanoscience and Technology
2. Realize different nano systems and recognize the advanced tools used for their analysis
3. Understand the reasons behind size dependent physical or chemical properties of nanomaterials
4. Analyze the phase transformation process and understand how to control that process for nanostructure creation
5. Introduce different methods available for the fabrication of nanostructures

Course Outcomes

1. Recognize different nanosystems and the tools for their analysis (K2)
2. Understand the size dependent physical phenomenons observed in nanomaterials (K2)
3. Realize the origin of surface energy, energy minimization and stabilization processes in nanosystems (K2)
4. Understand and apply the kinetics of phase transformation in nanosystems (K2,K3)

K1=Remember, K2= Understand, K3= Apply, K4= Analyze, K5= Evaluate, K6= Create

UNIT-I	Introduction to Nano-systems	11 Hours

Feynmann’s vision on nanoscience & technology, bulk vs nanomaterials, natural and synthetic nanomaterials. Quantum confinement in nanostructures- size dependent physical phenomena in semiconductor and metal nanoparticles. Classification of nanostructures, 0D, 1D and 2D nanostructures. Visualization of nanostructures and techniques related.

UNIT-II	Surface Energy	20 Hours

Surface energy and surface stress-origin and estimation of surface energy. Surface Energy minimization:- Sintering Ostwald ripening and agglomeration. Energy minimization by Isotropic and anisotropic surfaces. Surface energy and surface curvature, Surface energy stabilization- electrostatic stabilization, steric stabilization, electro-steric stabilization..

UNIT-III	Growth Kinetics of Nanomaterials	20 Hours

Kinetics of phase transformations, Homogeneous & Heterogeneous nucleation. Controlling nucleation, growth and aggregation in nanoparticle growth. Growth Mechanisms: Spontaneous growth, Evaporation condensation growth, growth controlled by diffusion and surface process, VLS growth, fundamentals of thin film growth.

UNIT-IV	Special Nanostructures	16 Hours
Diamond – Graphite- Fullerenes, CNTs and Graphene. Synthesis: CVD, Laser and Electrochemical and other methods. Functionalization and reactivity of CNTs. Micro & Mesoporous Materials, Ordered mesoporous structures, Random mesoporous structures, and crystalline microporous materials: zeolites. Core – Shell Structures **-** Metal-oxide structures, Metal-polymer structures, Oxide-polymer structures. Organic-Inorganic Hybrids- Class I hybrids, Class II hybrids, Intercalation Compounds.		
UNIT-V	**Contemporary Issues**	**5 Hrs**.
Expert lectures, General Seminars, online seminars – webinars		
	Total Lecture Hours	**72 Hours**

Course Code	NSP2C 10	SPECTROSCOPY	L	T	P	C
Core			4	0	0	4
Pre-requisite	Basic knowledge in general spectroscopy.		Syllabus Version		2022	

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

The main objectives of the course are to:

- Understand the fundamental concepts and principles in molecular spectroscopy.
- Learn the method of solving problems for different molecular systems.
- Understand the concepts of different types of spectra.
- Learn the method of evaluation of chemical problems spectroscopically.

Course Outcomes

1. Remember the fundamentals of concepts and principles in molecular spectroscopy – K1
2. Understand concepts of different types of spectra – K2
3. Understand different chemical systems with different types of spectra and solving problems based on it – K2, K3
4. Problem solving, evaluation and analysis capacity – K3, K4, K5

K1 – Remember K2 – Understand K3 – Apply K4 – Analyze K5 – Evaluate, K6- Create

UNIT-I	Microwave Spectroscopy	16 hours

Rotation spectra of diatomic and poly atomic molecules, Rigid and non-rigid rotator models, Asymmetric, symmetric and spherical tops. Isotope effect on rotation spectra, Stark effect, Nuclear and electron spin interactions. Rotational transitions and selection rules. Microwave spectrometer -Principles & Applications.

UNIT-II	Lower & Higher Energy Excitation Spectroscopy	16 Hours

Basic principles, Beer-Lambert’s Law, Molar extinction coefficient, intensity of electronic transitions. Types of electronic transitions. Franck- Condon principle, Ground and excited electronic states of diatomic molecules. Electronic spectra of polyatomic molecules. The fate of electronically excited state species - Vibrational relaxation, External conversion, Internal conversion, Fluorescence, Phosphorescence, Jablonski diagram. Electronic spectra of conjugated molecules - Dissociation and predissociation spectra. UV-Visible spectrophotometer – Principles & Applications. Fluorescence spectroscopy**,** Photoelectron spectroscopy (X-ray and Ultraviolet)**,** X-ray Fluorescence**,** Augur electron spectroscopy**,** Electron energy loss spectroscopy**.**

UNIT-III	IR and Raman Spectroscopy	15 Hours

Vibrational spectra of diatomic and poly atomic molecules, Harmonic oscillator model, Anharmonicity. Vibrational transitions and selection rules. Morse potential, Fundamentals, Overtones, Hot bands, Combination hands, Difference bands. Vibrational spectra of diatomic and polyatomic molecules, P, Q, R branches. IR and FTIR spectrophotometer - Principles - Instrumentation, Applications. Pure rational, pure vibrational Raman spectra, Vibrational, rotational Raman spectra, Selection rules, Mutual exclusion principle. Raman spectrophotometer - Principles – Instrumentation, Laser Raman spectroscopy, Applications.

UNIT-IV	Resonance Spectroscopy	20 Hours
Interaction between nuclear spin and magnetic field, Level population, Larmour Precession, Resonance condition, Bloch equations, Relaxation times, Spin-Spin and spin-lattice relaxation, The Chemical shift, Instrumentation for NMR spectroscopy, CWNMR and FTNMR, Imaging, Electron Spin Spectroscopy of the unpaired electron, Total Hamiltonian, Fine structure, Electron-Nucleus coupling and hyperfine structure, ESR spectrometer, Mossbauer Spectroscopy : Resonance Fluorescence of gamma - rays, Recoilless emission of gamma - rays and Mossbauer Effect, Chemical shift, Effect of electric and magnetic fields, Example of Fe57, Experimental techniques.		
UNIT-V	**Contemporary Issues**	**5 Hrs**.
Expert lectures, General Seminars, online seminars – webinars		
	Total Lecture Hours	**72 Hours**

3. Sawtooth Generator
4. Differentiator and Integrator
5. Low pass filter, High pass filter and Band pass filter
6. Astable Multivibrator
7. Single stage RC coupled Amplifier
8. Differential Amplifier using Transistor

Course Code	NSP3C 11	NUCLEAR AND PARTICLE PHYSICS	L	T	P	C
Core			4	0	0	4
Pre-requisite	Basic knowledge in nuclear and particle physics.		Syllabus Version		2022	

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

The main objectives of the course are to:

- Understand the fundamental concepts of nuclear structure and models.
- Learn the method of solving problems of different nuclear models and particle physics.
- Understand the concepts of different types of nuclear interactions.
- Learn the method of evaluation of conservation laws and symmetries.

Course Outcomes

5. Remember the fundamentals of concepts and principles of nuclear structure and models – K1
6. Understand concepts of different types of nuclear interactions and reactions – K2
7. Understand different conservation laws and symmetries of particle physics and solving problems based on it – K2, K3
8. Problem solving, evaluation and analysis capacity – K3, K4, K5

K1 – Remember K2 – Understand K3 – Apply K4 – Analyze K5 – Evaluate, K6- Create

UNIT-I	Nuclear Structure and Models	15 hours

Basic properties of nucleus: - Nuclear radius, distribution of nuclear charge, skin thickness, isotope shift, nuclear matter distribution, nuclear binding energy, Magnetic dipole moment - quadruple moment - Liquid drop model - Semi-empirical mass formula of Weizsacker - Nuclear stability - Mass parabolas - Bohr-Wheeler theory of fission - Shell model - Spin-orbit coupling - Magic Numbers-Elementary ideas of collective model.

UNIT-II	Nuclear Interactions	15 Hours

Nuclear forces - Two body problem - Ground state of deuteron - Meson theory of nuclear forces - Yukawa potential - Nucleon-nucleon scattering - Low energy n-p scattering - Effective range theory - Spin dependence, charge independence and charge symmetry of nuclear forces - Isospin formalism

UNIT-III	Nuclear Reactions	18 Hours

Radioactivity, Types of reactions and conservation laws - Reaction dynamics-Q-value equation Basics of alpha decay and Gamow's theory of Alpha decay, beta decay and energetic of beta decay, Fermi's theory of Beta decay, Kurie plots, Mass of the neutrino, life time, Allowed and forbidden transitions, selection rules and parity violation in beta decay, Neutrino physics - Non-conservation of parity - Gamma decay - Internal conversion -

Multipole moments, life times. Energetics of fission process, controlled fission reactions, fusion process and solar fusion, Nuclear radiation detectors.		
UNIT-IV	**Particle Physics**	**19 Hours**
Elementary particles; Types of interactions between - Hadrons and Leptons - Symmetry and conservation laws; Elementary ideas of CP and CPT invariance - Classification of Hadrons - SU (2) - SU (3) multiplets - Quark model - Gell-mann-Okubo mass formula for octet and decuplet Hadrons – Quantum chromo dynamics (QCD)-Elementary ideas of standard model of weak interaction and QCD		
UNIT-V	**Contemporary Issues**	**5 Hrs**.
Expert lectures, General Seminars, online seminars – webinars		
	Total Lecture Hours	**72 Hours**
Text Books/References		
1. K.S. Krane, 1987, Introductory Nuclear Physics, Wiley, New York. 2. D. C Thayal, Nuclear Physics, Himalaya Pub. House 1997 3. Y.Neeman and Y.Kirsh: "The particle hunters' (Cambridge University Press)		

Course Code	NSP3C 12	ADVANCED ANALYTICAL TECHNIQUES	L	T	P	C
Core Course			4	0	0	4
Pre-requisite	Basic knowledge in, Physical, Chemical or Biological sciences		Syllabus Version		2022	

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

1. To familiarize and understand the fundamental principles and concepts of characterization of nanostructured materials.
2. To categorize and understand the different techniques used for studying the structural, optical, morphological, thermal, magnetic and electrochemical properties of nanomaterials.
3. To understand the working principle and instrumentation of the characterization instruments.
4. Evaluation and analysis of experimental data obtained from different instrumentation techniques

Course Outcomes

1. Recognize various characterization techniques available for the studying different properties of nanostructured materials. (K1)
2. To apply the knowledge gained to correctly choose the most suitable characterization technique for studying the properties of nanomaterials.(K3)
3. To effectively use the knowledge gained in analyzing the obtained characterization data. (K4,K5)
4. To evaluate the characterization data and nurture the ability to explain the underlying mechanism.(K5)

K1=Remember, K2= Understand, K3= Apply, K4= Analyze, K5= Evaluate, K6= Create

UNIT-I	**Microscopic Techniques**:	**20 Hours**

Scanning Electron Microscopy (SEM), Transmission Electron Microscopy (TEM). Scanning Probe Microscopy: Atomic Force Microscopy, Scanning Tunnelling Microscopy (STM), Near field scanning optical microscopy (NSOM). Principles of Fluorescence microscopy. Confocal Laser Scanning Microscopy.

UNIT-II	**Techniques for Thermal & Mechanical Analysis**	**15 Hours**

Thermal Analysis: TGA, DTG, DTA, DSC - combustion calorimetry- Thermal diffusivity by the laser flash technique- simultaneous techniques including analysis for gaseous products. Mechanical testing- Introduction, tension testing, High strain rate testing of materials, Fracture Toughness testing methods, Hardness testing.

UNIT-III	**Magnetic & Electrochemical Techniques**	**15 Hours**

Magnetic Vibrating Sample Magnetometer, Mossbauer spectroscopy, ESR, NMR. Magneto-optic Kerr effect. Electrochemical Techniques: Cyclic voltammetry,

Electrochemical Impedance, Scanning electrochemical Microscopy, The quartz crystal micro balance.		
UNIT-IV	**Structure and Surface Analysis Techniques**	**17 Hours**
X-ray powder diffraction: principles and practices. Small angle X-ray diffraction, GIXRD, and Single crystalline X-ray diffraction. Hydrophobic and hydrophilic surfaces, Super hydrophobicity and hydrophilicity, Contact angle, BET surface area and porosity analysis.		
UNIT-V	**Contemporary Issues**	**5 Hrs**.
Expert lectures, General Seminars, online seminars – webinars		
	Total Lecture Hours	**72 Hours**

Course Objectives

The main objectives of the course are to:

1. Understand different top-down and bottom-up approaches available for nanomaterials synthesis.
2. Apply the knowledge on synthesis to properly design an experiment for tuning the size, shape and properties of the nanostructures
3. Understand and apply different lithographic techniques for the fabrication of nanostructures
4. Understand the fundamental principles and concepts related to the optical, electrical, magnetic, thermal and mechanical properties

Course Outcomes

1. Understand physical, chemical, and lithographic techniques available for the preparation of nanoparticles or nanostructures and apply the knowledge to select a proper synthetic approach for a specific application (K2. K5)
2. Create experimental design to control the size, shape, distribution and properties of nanoparticles (K6)
3. Apply and analyze the design criteria for the fabrication of nanostructures by lithography (K3,K4)
4. Evaluate and correlate the structure-property optimization using the data collected from different analysis (K5,K6)
5. Apply the size and shape dependence of materials properties for tuning the material for various applications (K3)
6. Review the advantages of using nanostructured materials for various applications and the challenges that will face while using nanomaterials (K5)

K1 – Remember K2 – Understand K3 – Apply K4 – Analyze K5 – Evaluate, K6- Create

UNIT-I	**Physical and Chemical Methods**	**20 Hours**

Introduction- Spontaneous growth, Vapor –Liquid-Solid (VLS) growth, and SWCNT and MWCNT growth mechganisms.Physical Vapour deposition techniques (PVD): Sputtering & e-beam Evaporation. Atomic layer deposition, Chemical vapour deposition method (CVD), Molecular beam epitaxy(MBE), & Electrospinning, Ball Milling. Chemical Methods: Nanoparticles through homogeneous &heterogenous nucleation in solution:-Co-precipitation method, Hydrothermal/ Solvothermal synthesis, Template based synthesis, Electrochemical synthesis, Sonochemical routes, Sol- gel, Micelles and microemulsions. Self-assembly methods and Langmuir Blodgett (LB) method.

UNIT-II	**Lithographic Techniques**	**10 hours**
Lithography- Photolithography- Laser lithography and SPM based lithography (AFM & STM), Dip pen lithography and nanomanipulation. E-beam/SEM lithography. X-ray Lithography, Focused Ion beam lithography, Microcontact printing, nanoimprint.		
UNIT-III	**Optical, Electrical & Magnetic Properties of Nanostructures**	**20 Hours**
Interaction of light with matter. The nano perspective. The surface plasmon resonance- applications of nano plasmonics. Quantum dots – Optical properties related to quantum confinement. Special luminescent materials - electroluminescence- photochromic and electrochromic nanomaterials. Electrical conductivity in nanotubes and nanorods and nanocomposites. Electronic transport in nanostructures, single electron transfer devices (SETs), Electron spin transistor – resonant tunnel devices - quantum interference transistors (QUITs). Introduction – magnetic phenomena and their classical interpretation- Magnetization and nanostructures. Superparamagnetic particles- susceptibility and related phenomena in superparamagnets- Magnetism in reduced dimensional systems- Two, one and zero dimensional systems. Physical properties of magnetic nanostructures - exchange coupled magnetic nanomaterials- spin –polarized tunneling- magneto-resistivity, GMR. Spintronics, Magneto electrical effects, ferrofluids, molecular nanomagnets, data storage applications of magnetic nanoparticles, Spintronic devices and applications.		
UNIT-IV	**Mechanical & Thermal properties of Nanostructures**	**17 Hours**
Nano-mechanics- Introduction- three atom chain- lattice mechanics- linear elasticity relations – molecular dynamics. Structure and mechanical properties of carbon nanotubes- nanomechanical measurement techniques- AFM – Nanoindentation. Nano-thermodynamics:- Thermodynamics the nano perspective – Background- application of classical thermodynamics to nanomaterials- small system thermodynamics. Modern nano-thermodynamics- Non-extensivity and nonintensivity – nano-thermodynamics of a single molecule – modeling nanomaterials.		
UNIT-V	**Contemporary Issues**	**5 Hrs**.
Expert lectures, General Seminars, online seminars – webinars		
	Total Lecture Hours	**72 Hours**

Pre-requisite	Basic knowledge in general physics, Chemistry and mathematics.		**Syllabus Version**		2022	

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

The main objectives of the course are to:

- Understand different computational tools.
- Learn the building up of z-matrix.
- Understand different kinds of modelling and simulations.
- Evaluate different computed results through various methods.

Course Outcomes

1. Introduction to different computational tools – K2
2. Understand the need and importance of computational studies in supporting scientific results – K1, K4
3. Learn to write z-matrix – K2, K3, K6
4. Understand different simulations and applications in nano technology – K2, K3

K1=Remember, K2= Understand, K3= Apply, K4= Analyze, K5= Evaluate, K6= Create

UNIT-I	**Introduction to Computational Calculations**	**20 Hours**

Potential energy scanning, saddle points, local and global minima. Geometry optimization, Molecular orbital, charges, electron density. Frequency calculation Interaction energy. ESP map. Global reactive descriptors. Fukui descriptors. Koopmans's theorem. Different (freeware and commercial)- Excel, Origin, chem. Draw/Chem Sketch, Gaussian 09, Gaussview5, SPSS, VASP, material studio.

UNIT-II	**Introduction to Computational Methods**	**20 Hours**

Basis sets- different types. Basis set truncation error. Electron correlation. Correlation energy. Basis set limit. Slater type orbitals and Gaussian type orbitals; z-matrix- basic idea and construction. Z-matrix of small molecules like H_2O, HCHO, CH_3OH and H_2O_2. Molecular mechanics. Semi-Empirical method. Ab initio method. Density functional theory method. Molecular dynamics. ONIOM method.

UNIT-III	**Introduction to Python**	**12 Hours**

Variables and Data Types, python strings and lists, Operators and their Precedence, Iteration: while and for loops, Python Syntax, Colon & Indentation, Syntax of 'for loops, Conditional Execution: if, elif and else, functions, Python modules and packages, File Input/Output, Exception Handling, The NumPy Module, Vectorized Functions.

UNIT - IV	**Computational Nanotechnology**	**15 Hours**

Quantum confinement; change in properties with size. Applications of computational studies in nanotechnology. Simulations-different types-Monte Carlo Methods (Detailed treatment).Nano-computing and modelling. Computing transport in materials. Nano-design Nano-CAD.		
UNIT-V	**Contemporary Issues**	**5 Hrs**.
Expert lectures, General Seminars, online seminars – webinars		
	Total Lecture Hours	**72 Hours**

Course Code	NSP3P 03	PRACTICAL -III	L	T	P	C
Core			0	0	2	2
Pre-requisite	Basic knowledge on different nanomaterials and their interesting properties		Syllabus Version		2022	

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

1. Understand and develop practical skill on different synthetic approaches for nanomaterials
2. Apply the physical and chemical phenomenon associated with nanomaterials by choosing suitable synthetic method
3. Develop data collection skill and analyze the data components using analysis software
4. Evaluate the experimental results with the theory associated with nanosystems
5. Hands on experience on using various sophisticated instruments for analysis

Course Outcomes

1. Understand and apply chemical and physical methods for the synthesis of nanomaterials (K2,K3)
2. Understand the advantages and disadvantages choosing a particular method for nanomaterial synthesis (K2)
3. Create awareness on the importance of data collection statistics and analysis of different types of data for proving the concepts studied (K4,K6)
4. Recognize different advanced tools available for data generation and analysis.(K2)

K1=Remember, K2= Understand, K3= Apply, K4= Analyze, K5= Evaluate, K6= Create

List of Experiments: (Only selected experiments will do: Maximum 10 experiments)

1. Synthesis of different sized Ag nanoparticles by aqueous method, Size distribution studies using DLS
2. Synthesis of different sized Au nanoparticles by aqueous method, Size distribution studies using DLS
3. Green Synthesis of Nanoparticles.
4. Sol-gel synthesis of ZnO nanoparticles.
5. Analysis of optical properties of ZnO nanoparticles
6. Geometry optimization and frequency calculation using Gaussian program.
7. Introduction to Origin software for data analysis
8. Structure and physical property elucidation of small molecules using Chem Draw/Chem Sketch.
9. Chemical synthesis of CdSe Quantum dots with different sizes.
10. Band gap estimation of CdSe quantum dots by using optical spectroscopy
11. Exciton and plasmon interaction studies of Au-CdSe system by using optical spectroscopy

12. Operation of Electrochemical Workstation
13. Deposition of Polyaniline on ITO/FTO using Electrochemical Workstation.
14. Structural elucidation of Electrodeposited polyaniline using FTIR
15. Chemical Synthesis of Magnetic nanoparticles and size determination.
16. Electrochemical synthesis of TiO2 Nanostructures. Optical Studies by using UV-VIS spectrophotometer. Electronic structure analysis by using Cyclic Voltammetry.
17. Electrochemical Synthesis of ZnO nanorods - Optical Studies by using UV-VIS spectrophotometer. Electronic structure analysis by using Cyclic Voltammetry.
18. Thin film deposition of TiO_2 and ZnO by Electrochemcial method – Study the optical and electronic properties.
19. Compare the results of 1D structure with 2D thin films of both TiO_2 and ZnO.
20. Thin film preparation using spin coating method and thickness measurement using Profilometer.
21. Hall measurements of electrodeposited TiO2 thin films
22. Performing Potential energy scanning and geometry optimization
23. Frequency calculation and interpretations
24. Prediction of electronic transitions and analysis of MOs
25. Calculation of global reactive parameters through Koopmans's theorem
26. Prediction of possible conformers and interactions
27. Prediction of correlation coefficient
28. Calculation of global reactive parameters through orbital energy method
29. Calculation of binding/stabilization energy
30. Prediction of donor-acceptor interactions
31. Calculation with periodic boundary conditions

SYLLABUS
of
ELECTIVE COURSES

Course Code	**NSP4E 01**	**NANOSTRUCTURED SOLAR CELLS**	**L**	**T**	**P**	**C**
Elective			**4**	**0**	**0**	**4**
Pre-requisite	Basic knowledge in Nanoscience		**Syllabus Version**		**2022**	

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

1. Conscious of energy crisis, its reason, current status and possible solutions
2. Recognize renewable and non-renewable energy resources and their contribution towards global energy production
3. Importance of re-newable energy resources and tapping such energies
4. Role of Nanoscience or nanotechnology in producing novel materials and designs for efficient production of energy using renewable resources

Course Outcomes

1. Analyze the reasons for energy crisis and understand the importance of sustainable energy development (K4,K2)
2. Understand Hydrogen economy and advantages and challenges of Hydrogen fuel and its production (K2)
3. Understand the possibilities of solar energy production using nanostructured materials and create awareness on using solar panels for house hold and other energy usages. (K2,K6)
4. Analyze the importance of different design architectures for efficient tapping of solar energy using nanoscience (K4)

K1=Remember, K2= Understand, K3= Apply, K4= Analyze, K5= Evaluate, K6= Create

UNIT-I	**Primary Perspective in Energy Conversion**	**14 Hours**

Current energy scenario; Energy and climate: - Greenhouse effect, conventional energy sources Vs non-conventional energy sources. Outline of alternative energy schemes – solar, wind, biomass, hydro, and nuclear. Clean low cost, sustainable energy development, prospects of renewable energy.

UNIT-II	**Photovoltaic Solar Energy Conversion**	**16 Hours**

Properties of sunlight: Solar radiation at earth’s surface- Air Mass. Semiconductors and junctions, carrier generation, Recombination, Carrier Transport, Solar cell operation, Principles of photovoltaic energy conversion (PV), Solar cell parameters, Factors affecting the solar cell efficiency, Types of photovoltaic Cells.

UNIT-III	**Silicon Solar Cells**	**20 Hours**

Si solar cells- Structure, and working. Optical properties, optical losses, antireflection coating, light trapping. Reducing recombination, Silicon solar cell manufacturing, Silicon wafers, processing technologies, solar cell fabrication technologies, Modules and arrays, inter connection issues, temperature effects and other effects. Efficiency measurements, IV

Characterization, Life time etc. General materials properties of silicon. Types of silicon solar cells.		
UNIT-IV	**Nanostructured Solar Cells**	**17 Hours**
Fundamentals of nanostructured solar cells, nanostructures in conventional thin film solar cells. Dye sensitized solar cells (DSSC), Design and working. Quantum dot sensitized solar cells (QDSSC), Design, working and charge transfer kinetics. Organic solar cell, Organic-Inorganic Hybrid Bulk Hetero Junction (BHJ-SC) Solar cells, Nanostructured ETA solar cells, Current status and future direction.		
UNIT-V	**Contemporary Issues**	**5 Hrs.**
Expert lectures, General Seminars, online seminars – webinars		
	Total Lecture Hours	**72 Hours**

Course Code	NSP4E 02	NANOMATERIALS FOR PHOTOCATALYSIS AND SOLAR FUEL GENERATION	L	T	P	C
Elective			4	0	0	4
Pre-requisite	Basic knowledge in nanomaterials and their synthesis		Syllabus Version		2022	

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

1. Familiarize students the importance of nanomaterials for sustainable development.
2. Enhancing the student’s knowledge on nanomaterials for environmental remediation.
3. Understand the photocatalysis reactions for solar fuel generation.
4. Apply the knowledge gained for developing efficient nanostructured photocatalysts.

Course Outcomes

1. Understand the benefits of nanomaterials for sustainable development (K2)
2. Analyze the concepts of photocatalysis and its technological significance. (K4)
3. Apply the photocatalysis reaction mechanisms towards contaminant degradation, hydrogen evolution and carbon dioxide reduction. (K3)
4. Create strategies for developing efficient nanostructured photocatalysts.(K6)

K1=Remember, K2= Understand, K3= Apply, K4= Analyze, K5= Evaluate, K6= Create

UNIT-I	Photocatalysis	20 Hours

Introduction; Light and matter interaction; Principles of Photocatalysis; Electronic band structure of semiconductors; Mechanisms of charge formation, separation and transfer; Basic principles of photocatalytic water splitting for hydrogen generation; Basic principles of photocatalytic reduction of CO_2; Photocatalysis surface and active species.

UNIT-II	Environmental Remediation	16 Hours

Introduction; Fabrication of nanostructured photocatalysts; Methods of improving photocatalytic activity: Design parameters; Photodegradation of dyes; Photodegradation of persistent organic pollutants; Photodegradation of Inorganic pollutants; Photodegradation of emerging contaminants; Photodegradation of gaseous pollutants; Characterization and analysis of acquired data.

UNIT-III	Hydrogen Evolution and Carbondioxide Reduction	16 Hours

Introduction; Electronic band structure considerations; Photocatalytic reaction mechanism and charge transfer; Fabrication of nanostructured photocatalysts and design parameters: H_2 generation and CO_2 reduction; Z-scheme heterojunction photocatalysts; Quantification and calculation of efficiency; Characterization

UNIT-IV	**Strategies for Improving Performance of Photocatalysts**	**15 Hours**
Introduction; Issues related to single-component photocatalysts; Microstructure modulation; Influence of facet and defects; Integration of noble metal nanostructures; Carbonaceous materials compounding – rGO, CNTs, CQDs; Integration with other semiconductor nanostructures.		
UNIT-V	**Contemporary Issues**	**5 Hrs**.
Expert lectures, General Seminars, online seminars – webinars		
	Total Lecture Hours	**72 Hours**

Course Code	NSP4E 03	MICRO/NANO ELECTRO MECHANICAL SYSTEMS (MEMS/NEMS)	L	T	P	C
Elective			4	0	0	4
Pre-requisite	Basic knowledge in nanoscience and nanodevices		Syllabus Version		2022	

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

1. Understand an overview of MEMS and NEMS
2. Understand different fabrication methods of MEMS/NEMS
3. Identify the applications of MEMS/NEMS
4. Understand different characterization tools of MEMS/NEMS

Course Outcomes

1. Understand the basics and working principles of MEMS/NEMS (K2)
2. Recognize different application potential of MEMS/NEMS (K2)
3. Evaluate the quality of MEMS/NEMS using different characterization tools (K5)
4. Understand the Cross-disciplinary application of MEMS and NEMS (K2)

K1=Remember, K2= Understand, K3= Apply, K4= Analyze, K5= Evaluate, K6= Create

UNIT-I	MEMS Fabrication	18 Hours
Overview of micro electro mechanical devices and technologies. Introduction to architecture design, Process flow, Fabrication, Packaging and testing. MEMS Fabrication, Deposition, lithography, and etching, Surface micromachining, Bulk micromachining, Bonding technologies, LIGA technology and related fabrication methods		
UNIT-II	**Applications of MEMS**	**18 Hours**
MEMS device concepts (micro sensors/actuators), Use of capacitive, Inductive, Optical, piezoresistive, Piezoelectric methods for sensing. MEMS Applications, Accelerometers and gyros, Pressure sensors, Micro optics, etc. Microsystems Packaging		
UNIT-III	**MEMS/NEMS Characterization**	**15 Hours**
Introduction to existing and next-generation metrology tools for MEMS and NEMS inspection and qualification. Theoretical principles of metrology and experimental work on characterization of prototype MEMS and NEMS devices.		
UNIT-IV	**Biological Applications of MEMS/NEMS**	**16 Hours**
Cross-disciplinary application of MEMS and NEMS to the biological sciences. Interaction of living cells/tissues with nanofabricated structures, Microfluidics for the movement and control of solutions - the development of I/O architectures for efficient readout of bioreactions.		
UNIT-V	**Contemporary Issues**	**5 Hrs.**
Expert lectures, General Seminars, online seminars – webinars		
	Total Lecture Hours	**72 Hours**

Elective			4	0	0	4
Pre-requisite	Basic knowledge on nanomaterials		**Syllabus Version**		**2022**	

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

1. Understand the toxicity of nanomaterials
2. Aware of environmental pollution act and importance of Green Chemistry
3. Understand different green synthetic approaches for the nanomaterial
4. Understand the environmental applications of nanomaterials

Course Outcomes

1. Understand the environmental pollution and could recognize the nanomaterial toxicity (K2,K1)
2. Understand the importance of Green Chemistry (K2)
3. Apply different green synthesis approach for the materials preparation (K3)
4. Apply the nanomaterials for environmental protection (K3)

K1=Remember, K2= Understand, K3= Apply, K4= Analyze, K5= Evaluate, K6= Create

UNIT-I	**Nanomaterials Toxicity**	**18 Hours**
Environmental pollution and hazards: Toxicity of chemicals and their characterization, R&S Numbers, material safety data sheet (MSDS), highly toxic nanomaterials.		
UNIT-II	**Principle of Green Chemistry**	**18 Hours**
Environmental Pollution content Act (USEPA) 1990, Green chemistry, 12 principle of green chemistry, atom economy, alternative solvents, renewable materials, etc.		
UNIT-III	**Green Synthesis of Nanomaterials**	**15 Hours**
Green methods for nanomaterial synthesis, use of supercritical carbon dioxide, ionic liquids, RESS process, use of green reagents (citrate and glucose based synthesis of metal nanoparticles) biosynthesis of nanostructures, template-free synthesis of mesoporous silica and metal oxide		
UNIT-IV	**Environmental Applications of Nanomaterials**	**16 Hours**
Environmental application of nanomaterials. Water purification system, systems for harvesting solar energy, mesoporous materials for naked eye detection of toxic metal ions in water (mesosporous silica) self –cleaning materials, non-wetting glasses, super hydrophobic coatings etc.		
UNIT-V	**Contemporary Issues**	**5 Hrs**.
Expert lectures, General Seminars, online seminars – webinars		
	Total Lecture Hours	**72 Hours**

Course Code	NSP4E 06	COMPUTATIONAL STUDIES ON BIO-ACTIVE COMPOUNDS	L	T	P	C
Elective			4	0	0	4
Pre-requisite	Basic knowledge in general Chemistry and mathematics.		Syllabus Version		2022	

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

The main objectives of the course are to:

- Understand different computational tools.
- Learn different bio-active compounds.
- Learn drug likeness.
- Learn about computational study of bio-active compounds.

Course Outcomes

1. Understand different bio-active compounds – K2
2. Understand the need and importance of computational studies in supporting scientific results – K1, K4
3. Learn drug likeness and related parameters – K2, K3, K6
4. Understand different drug-target interactions– K2, K3

K2 – Understand K3 – Apply K4 – Analyze K6 - Create

UNIT-I	Errors and Statistical Tools in Data Analysis	15 Hours

Significant figures. Errors and classification; accuracy and precision; significant figures and rules; selection of data- T-test; F-test; Q-test; Euler's theorem- exact and inexact differentials; Cartesian-polar-spherical coordinates.

UNIT-II	Bio-active Compounds & Metals in Medicine	16 hours

Natural products. Classification: flavonoids, terpenoids, steroids, alkaloids. Structure and general characteristics. Proteins. DNA. RNA. Biological interactions. Medicinal importance of bio-active compounds. Some examples. Bio-activities. Metal toxicity and homeostasis. Metal deficiency and diseases. Toxic effects of metals. Effect of deficiency and excess of essential metal ions. Toxicity due to non-essential elements. Speciation of metal ions. Detoxification mechanism. Role of lithium and aluminium in biological systems. Chelation therapy and chemotherapy. Metal complexes as drugs. Anticancer drugs and Vanadium based diabetics drugs. Inorganic pollutants in natural water. Plants as accumulators of elements. Indicator plants and biominerals.

UNIT-III	Introduction to Medicinal Chemistry	20 Hours

Features of Drug like molecules. Drug classification: synthetic, semi-synthetic and non-synthetic drugs. Drug classification according to medicinal use: pharmacodynamic medicinal use. Pharmacodynamic agents and chemotherapeutic agents. Lipinski's rule of 5. Examples of receptors and discussion about drug-receptor interaction. Physicochemical properties determining biological activity such as solubility, acidity and reactivity. Importance of liphophilicity constant (logP) for predicting solubility. Calculation of

logP value for medicinal compounds. Factors determining stability and bioavailability of medicinal compounds. Isosterism and bio-isosterism.Influence of structural features of drugs (such as optical and geometrical isomerism) on biological activities. ED50, IC50, TD50 and LD50. A brief introduction on the following terms: Pharmacology, Pharmacodyn amics, Pharmacokinetics and ADME, pharmacotherapeutics, pharmacogency, toxicology, Basic steps in drug discovery: from lead discovery to commercialization (a brief introduction only) structural activity relationship (SAR) studies in lead discovery and optimization. Modern synthetic methods of lead synthesis and lead optimization.		
UNIT-IV	**Computation of Bio-active Compounds**	**16 Hours**
Combinatorial chemistry. General computational methodology and evaluation of computed results. QSAR/QSPR study. Developing 2D and 3D QSAR/QSPR models. Molecular docking and drug-target interactions. Statistical analysis of computed results. Donor-acceptor interactions. Different biological assays: Antioxidant; DPPH, TEAC. Merits and demerits of experimental studies on antioxidant activities. Importance of computational studies on evaluating antioxindant capacities. theoretical antioxidant mechanisms and their computational evaluation. Evaluation of UV filtering and metal chelation capacity. Multi target interactions.

Core			4	0	0	4
Pre-requisite			Syllabus Version		2022	

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

The main objectives of the course are to:

1. To understand the applications of various precision nanomaterials in different aspects of Science
2. To analyse the potentials of precision nanoprobes in cancer therapeutics.
3. To evaluate the uses of different nanoprobes in catalysis, sensing, fabrication of solar cells and light-emitting devices.
4. To create new functional nanoprobes for advanced applications.

Course Outcomes

1. This course is designed to understand (K1) the applications of precision nanomaterials in different aspects of Science, including catalysis, sensing, fabrication of solar cells and light-emitting devices, and biology (K3, K6).
2. This particular course module will help students to analyse (K2) each precision nanoprobe at the laboratory level.
3. Towards the end of this course, students could evaluate (K3) which precision nanoprobes will be ideal for specific applications.
4. Such experience will help to create (K4) novel precision materials during their Ph.D. career.

K1 – Remember K2 – Understand K3 – Apply K4 – Analyze K5 – Evaluate, K6-Create

UNIT-I	Precision Nanoclusters: Origin, Synthesis, & Characterization	17 Hours

Polydisperse nanoparticles to monodisperse nanoparticles and monodisperse nanoparticles to atomically precise nanoclusters – Brust synthesis and beyond. Electronic and geometric stability of nanoclusters (Magic numbers). Size-focused synthesis of gold, silver, and copper nanoclusters – Chemical reduction method, LEIST methodology, carbon monoxide reduction method. Different isolation techniques – Fractionated precipitation, recrystallization, solvent extraction, polyacrylamide gel electrophoresis, Size exclusion chromatography, High – performance liquid chromatography, Thin – layer chromatography. Synthesis and separation of highly stable gold and silver nanoclusters (eg: $Au_{25}(SR)_{18}$, $Au_{38}(SR)_{24}$, $Au_{102}(SR)_{44}$, and $Ag_{29}(BDT)_{12}(TPP)_4$). Understanding composition and structure of nanoclusters using advanced mass spectrometry (ESI-MS and MALDI-TOF), Single crystal studies, Transmission electron microscopy, and other spectroscopic and microscopic techniques (XPS, absorption and photoluminescence spectroscopy). Theoretical models of structures of gold nanoclusters – "Divide and protect model" concept, Inherent structure rule, Superatom complex model, Superatom network model, Grand unified model (Brief). Precision nanoclusters protected with ligands other than thiols.

UNIT-II	Optical Properties of Nanoclusters	15 hours
Optical properties – Optical absorption and Photoluminescence – Capping the gold core with different ligands, Tailoring core size and doping, Aggregation-induced emission. Nonlinear properties – Two-photon absorption/emission, Second harmonic generation. Ultrafast electron dynamics – Metallic or nonmetallic state of gold nanoparticles, Electron and energy transfer. Electrochemical properties (Brief).		
UNIT-III	**Chemistry of Nanoclusters**	**18 Hours**
Chemistry of metallic core – Modification by doping and formation of heterometallic nanoclusters (bimetallic, trimetallic, etc). Chemical reactivity – Intercluster reactions. Chemistry of ligands – Role of ligands in the size and structure of nanoclusters, Energy/Electron transfer, Isomerization, photosensitization. Ligand exchange, Ligand conjugation – coupling (EDC or DCC) reaction, and Click reaction. Stability of nanoclusters – Optical stability, thermal stability. Self-assembly of nanoclusters using various molecular driving forces (eg: Hydrogen bonding, Electrostatic interactions, Van der Waals interactions, Dipolar interactions, C-H···π/π···π interactions, Amphiphilicity, Metal chelation, Metal–metal interactions, Light-triggered dipole – induced attractions, and external Templates).		
UNIT-IV	**Applications of Nanoclusters**	**17 Hours**
Catalysis – Oxidation (eg: CO, styrene, alcohol, cyclohexane), Hydrogenation (selective, alkyne, nitro compounds), C−C coupling reactions, Electron – transfer catalysis, Hydrolysis, Electrocatalysis, Photocatalysis. Sensors – Cation or anion sensing, Molecular sensing, Biosensing (glucose, biothiols, ATP, protein, and nucleic Acid). Applications in Solar cells and Light-emitting devices. Biological applications – Antimicrobial, Biolabelling, Bioimaging, Biomedical targeting, and Cancer Therapeutics – photodynamic, and photothermal Therapy.		
UNIT-V	**Contemporary Issues**	**5 Hours**
Expert lectures, General Seminars, online seminars – webinars		
	Total Lecture Hours	**72 Hours**

Course Objectives

1. To develop basic understanding about materials in medicine.
2. To introduce the concepts of biomaterials and their evaluation.
3. To learn the various structure and forms of biomaterials including the ‘nano-biomaterials’.
4. To familiarize with the clinical importance of biomaterials.

Course Outcomes

1. This course is designed to develop basic knowledge (K1) related to materials used in medical field.
2. The detailed description of course module will help students to understand (K2) the physico-chemical and biological characterization methods of materials at the laboratory level.
3. Introduce the concept of nano-biomaterials and their potential applications (K3).
4. The course will help the students to analyze (K4) the scope of tissue engineering scaffolds, so that they would be able to evaluate (K5) and choose biomaterials for specific applications.
5. Such experience will create (K6) interest in students to pursue a career in biomedical research.

Course Code	NSP4E 09	SOLID STATE PHYSICS OF MATERIALS	L	T	P	C
Core			4	0	0	4
Pre-requisite	Basic knowledge in solid state physics		Syllabus Version	2022		

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

The main objectives of the course are to:

- Elaborate the fundamental understanding of solid state physics of materials
- Provide in depth knowledge of energy band structure of solid state materials
- Enumerate the physical properties of solid state materials
- Provide knowledge on alloys, nuclear materials and liquid crystals

Course Outcomes

The course outcomes can be as follows:

1. Understand the band structure of solids -K2, K3
2. Apply the basic properties for realizing the applications – K3, K5
3. Apply the knowledge of band structures to estimate the bandgap of nanomaterials – K3, K4
4. Apply the fundamental knowledge of bulk solids to enumerate and evaluate the properties of nanostructured materials – K3, K5, K6

K1 – Remember K2 – Understand K3 – Apply K4 – Analyze K5 – Evaluate K6 – Create

UNIT-I	Metallic Materials	15 Hours

Band structure of metals - Brillouin zones, Wigner Seitz approximation, Energy wave vector curves, Brillouin zones relationship with Bragg plane, Density of states, Fermi surface – FCC & BCC structures – De Haas van Alphen effect. Electronic properties of metals – Boltzmann transport equation, Electrical conductivity, Thermal conductivity, Galvanomagnetic effects, Thermionic and Field emission in metals.

UNIT-II	Semiconductor Materials	16 hours

Energy bands, Effective mass, Direct and indirect bandgap in semiconductors, Determination of bandgap, Donors and acceptors, Carrier concentrations at thermal equilibrium, Calculation of Fermi level, Degenerate and non-degenerate semiconductors. Semiconductor Crystal growth – Introduction, Methods: Bridgman, Czochralski, zone melting/refining techniques. Analysis of contact phenomenon: semiconductor-semiconductor, metal-semiconductor contacts, Schottky and Ohmic contacts, Semiconductor devices fabrication: Fabrication of junctions - wafer preparation, IC technology: monolithic IC, masking and etching, elements of lithography.

UNIT-III	Insulator Materials	16 Hours

Heat capacity of Insulators, Einstein's model, Quantisation of lattice vibration - continuum model, Debye's theory. Vibrations of monoatomic lattice - specific heat of one dimensional lattice of identical atoms. Phonon spectra of diatomic lattice and phonon modes - optical properties in infra-red region and their applications. Scattering of electromagnetic waves

and neutrons by phonons. Thermal conductivity of insulators - lattice thermal resistivity - Umklapp process. Thermal expansion: Potential wells in crystal binding - anharmonic interactions and thermal expansion of insulators.		
UNIT-IV	**Alloys and Nuclear Materials**	**15 Hours**
Alloys: Long range order theory, Super lattices and transitions. Diffusion in alloys - Darken's equations, Determination of diffusion coefficient. Special alloys - ferrous and non-ferrous. Super alloys. Nuclear materials: General aspects of reactor design. Fissile materials used in different types of reactors- Moderator and coolant and cladding materials. Radiation effects in materials - Swelling, He-embrittlement, induced radioactivity. Erosion and fretting corrosion-stress corrosion cracking, H_2-embrittlement.		
UNIT-V	**Liquid Crystalline Materials**	**10 Hours**
Classification of liquid crystals, Elementary ideas. Properties of liquid crystals - birefringence, dielectric anisotropy, viscosity, conductivity anisotropy and elasticity of liquid crystals, electro-optic, thermo-optic effects, LCD devices and applications.		
	Total Lecture Hours	**72 Hours**

of
AUDIT COURSES

Course Code	NSP1A 01	ABILITY ENHANCEMENT COURSE (AEC)	L	T	P	C
Audit Course			1	1	0	2
Pre-requisite	None		Syllabus Version	2022		

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

1. Skill identification for students in their respective field of study.
2. Recognize different research methodologies by introducing new research environments
3. Understand the basic concepts of research process
4. Make the student to work in a group by sharing knowledge

Course Outcomes

1. Recognize the skills associated with each student (with academic or industry) (K1)
2. Create research attitude suitable for academia or industry (K6)
3. Understand the process of defining a research problem and the importance of data analysis (K2)
4. Create better communication skill (K6)

K1=Remember, K2= Understand, K3= Apply, K4= Analyze, K5= Evaluate, K6= Create

UNIT-I	RESEARCH METHODOLOGY	6 Hours

Research- what is research, need of research, types of research, application of research in business. Research process- selection of topic of interest, formulation of a research problem, design a research, construct instrument for data collection, reliability and validity of instrument, sample, data collection, data processing and analysis, displaying results, repeatability, questionnaire designing, research report.

UNIT-II	INDUSTRIAL/RESEARCH INSTITUTION VISIT	6 Hours

Understanding basic concepts of research/research process, motivation and objective of research, research problem, familiarize with instruments for data collection.

UNIT-III	INTERNSHIP	25 Hours

Experience in new environment, selection of a new topic, formulating a new research problem, data collection, data analysis,discussion of results, presentation of results, research report and publications.

UNIT-IV	RESEARCH PRESENTATION	5 Hours

Importance of conferences, seminars, workshops, publications in peer reviewed national / international journals, patents. Power point preparation- Introduction/preample, data display, discussion of results, conclusion, time management, communication.

	Total Lecture Hours	42 Hours

Text Books/References

1. Research methodology: (Concepts and Cases) Deepak Chawla, Neena Sondhi,
2. Research methodology (Methods and Techniques) CR Kothari, Gaurav Garg

Course Code	NSP2A 02	PROFESSIONAL COMPETENCY COURSE (PCC)	L	T	P	C
Audit Course			1	1	0	2
Pre-requisite	None		Syllabus Version	2022		

L= Lecture, T= Tutorial, P- Practical, C= Credits

Course Objectives

1. Inculcate scientific writing and communication skill
2. Understand the basic ethical issues confronted by the scientist
3. Recognize the skill areas the student would like to develop
4. Create awareness on the fundamentals of technology transfer

Course Outcomes

1. Understand the scientific paper or thesis writing skill (K2)
2. Realize the ethical issues associated with scientific research and capable to analyze and address unethical situations (K2,K4)
3. Able to evaluate their own values and interests as they relate to their professional careers. (K5)
4. Understand the fundamentals of technology transfer and issues related (K2)

K1=Remember, K2= Understand, K3= Apply, K4= Analyze, K5= Evaluate, K6= Create

UNIT-I	Scientific Writing and Communication Skill	12 Hours

iting and communication skill is very much essential to express scientific ideas or results clearly to validate their significance. For the successful publication of a research work, development of scientific writing skill is essential. Writing Research report, research proposals. Every aspect of writing scientific grants from funding agencies. Introduction to every aspect of grant writing, including selecting funding mechanisms, writing individual grant sections and understanding administrative policies. Strategies for effective scientific writing-core elements of each sections- Principles of writing research manuscript by composing and editing the sections- Familiarization with reference manager- how to peer review an article from the perspective of a researcher- reviewer- journal editor – complete and submit a research manuscript (based on an abstract given). Patent filing.

UNIT-II	Integrity in Scientific Research	10 Hours

miliarize the graduate students with the basic ethical issues confronted by the scientist. To gain insight into how one can responsibly conduct research throughout their career - To know how to properly address unethical situations- To realize that new ethical issues/ concerns will arise and that the best way to tackle these will be to discuss ethical situations with colleagues, seek guidance from proper channels, and routinely participate in conduct of research training courses/ seminars. Importance of team work, group discussion and collaborative research (MOU etc.), Know about plagiarism.

UNIT-III	**Individual Development Plan**	**10 Hours**
dividual development plan is intended for the graduate students before they go on to job market. Give opportunity to the participants to evaluate their own values and interests as they relate to their professional careers. Introduce the students to three or four different career tracks such as industry (profit or non profit), government sector, academic, scientific institution, etc.. ask the student to identify the skill areas they would like to develop.		
UNIT-IV	**Fundamentals of Technology Commercialization**	**10 Hours**
novative transformation of scientific and technical knowledge into commercial products and services. Importance of cross-disciplinary teams of students to asses real technologies for commercial applications with a specific focus on developing an understanding of the commercialization process, and skills in licensing and new venture development. Introduce concepts that improve and accelerate the commercialization process. From decisions made by scientists at the research bench, through the development, patenting, and licensing of new technologies, to the formation of entrepreneurial enterprises and monetization of assets. Data sharing with stake holders.		
	Total Lecture Hours	**42 Hours**
